

File system Security

General Principles

- Files and folders are managed by the operating system
- Applications, including shells, access files through an API
- Access control entry (**ACE**)
 - Allow/deny a certain type of access to a file/folder by user/group
- Access control list (**ACL**)
 - Collection of ACEs for a file/folder
- A **file handle** provides an opaque identifier for a file/folder
- File operations
 - Open file: returns file handle
 - Read/write/execute file
 - Close file: invalidates file handle
- Hierarchical file organization
 - Tree (Windows)
 - DAG (Linux)

Discretionary Access Control (DAC)

- Users can protect what they own
 - The owner may grant access to others
 - The owner may define the type of access (read/write/execute) given to others
- DAC is the standard model used in operating systems
- Mandatory Access Control (MAC)
 - Alternative model not covered in this lecture
 - Multiple levels of security for users and documents
 - Read down and write up principles

Closed vs. Open Policy

Closed policy

- Also called “default secure”
- Give Tom read access to “foo”
- Give Bob r/w access to “bar”
- Tom: I would like to read “foo”
 - Access allowed
- Tom: I would like to read “bar”
 - Access denied

Open Policy

- Deny Tom read access to “foo”
- Deny Bob r/w access to “bar”
- Tom: I would like to read “foo”
 - Access denied
- Tom: I would like to read “bar”
 - Access allowed

Closed Policy with Negative Authorizations and Deny Priority

- Give Tom r/w access to “bar”
- Deny Tom write access to “bar”
- Tom: I would like to read “bar”
 - Access allowed
- Tom: I would like to write “bar”
 - Access denied
- Policy is used by Windows to manage access control to the file system

Access Control Entries and Lists

- An **Access Control List** (ACL) for a resource (e.g., a file or folder) is a sorted list of zero or more **Access Control Entries** (ACEs)
- An ACE refers specifies that a certain set of accesses (e.g., read, execute and write) to the resources is allowed or denied for a user or group
- Examples of ACEs for folder “Bob’s CS167 Grades”
 - Bob; Read; Allow
 - TAs; Read; Allow
 - TWD; Read, Write; Allow
 - Bob; Write; Deny
 - TAs; Write; Allow

Linux vs. Windows

- Linux
 - Allow-only ACEs
 - Access to file depends on ACL of file and of all its ancestor folders
 - Start at root of file system
 - Traverse path of folders
 - Each folder must have execute (cd) permission
 - Different paths to same file not equivalent
 - File's ACL must allow requested access
- Windows
 - Allow and deny ACEs
 - By default, deny ACEs precede allow ones
 - Access to file depends only on file's ACL
 - ACLs of ancestors ignored when access is requested
 - Permissions set on a folder usually propagated to descendants (inheritance)
 - System keeps track of inherited ACE's
